

Integrity Management Notification Review Process

Integrity Management Notification Review Process

The integrity management rule allows operators the option of notifying OPS in three situations where their actions may deviate from the actions specified in the rule:

1. Inability to meet required repair schedules and cannot provide safety by interim pressure reduction
2. Intention to use “other technology” to perform assessments
3. Extension of reassessment interval

Notification in these situations affords OPS the opportunity to review the circumstances to determine whether they create a need for early inspection and possible enforcement action. In making this determination, OPS intends to use the following process (step numbers refer to the numbered boxes on the flow chart):

1. The integrity management rule requires that notifications be submitted to OPS headquarters in writing or by facsimile. OPS has also informed operators that they may submit notifications via the Integrity Management Database (IMDB) (<http://primis.rspa.dot.gov/imdb>). If submission is via the database, then operators need not mail or fax.
2. OPS will determine, based on information included in the notification, whether the pipeline segment involved is an intrastate line potentially subject to state jurisdiction.
3. OPS will determine if an intrastate line is located in a state that has a certified hazardous liquid pipeline program.
4. Notifications concerning interstate pipeline segments (and intrastate pipeline segments in states not having certified programs) will be considered by OPS reviewers. Reviewers will typically include all Regional Directors and subject matter experts as appropriate. Comments will be solicited from states with certified hazardous liquid pipeline regarding notifications concerning interstate pipelines in their state. State program directors will be included as reviewers if the state is an interstate agent.
5. Each OPS reviewer will note whether he/she notes any basis to object to the actions proposed by the operator, indicating a possible need for a special inspection. These comments will be reviewed by OPS headquarters. The process will repeat until agreement is reached.
6. If all reviewers agree there are no objections, the notification status in IMDB will be revised to so state. (This status will also display on the public web site, as described below).

7. OPS will draft a letter to the operator in instances in which objections are noted, describing the basis for the objections and additional actions the operator can take to reduce the need for a special inspection.
8. The response to the operator, in instances in which objections are noted, will be signed by the appropriate OPS Regional Director or his/her designee.
9. States with certified hazardous liquid programs are responsible for review of notifications concerning intrastate lines under their jurisdiction. These reviews will be conducted by the state using procedures the state finds appropriate to its circumstances. The purpose of the state review, again, will be to determine if the state has technical objections to the alternative actions described in the notification (which may create a need for a special inspection), and to take appropriate action with the operator if such objections are noted. OPS will forward notifications subject to state reviews to state program officials, along with information regarding any similar notifications previously reviewed.
10. The cognizant OPS Regional Director will receive copies of notifications forwarded to states for review. The Regional Director will provide assistance as appropriate. States will inform the Regional Director of the results of their review, including providing copies of any relevant correspondence. The Regional Director will assure these results are recorded in IMDB, as appropriate.
11. The notification status in IMDB will be changed to show that objections have been noted. Objections communicated to an operator will be posted.
12. OPS will follow-up with operators who receive letters informing them of technical objections to their notifications to determine whether the operator plans to change its intended actions. Special inspections will be conducted as needed. Enforcement action will be taken in cases where it is determined that operators are not in compliance with the regulation.

Each operator will have access to records of its own notifications on IMDB. The operator's primary contact (as indicated in the notification record) will receive an e-mail informing him/her each time the status of a notification is changed in the database.

Summary information regarding all notifications will be available on the Implementing Integrity Management website, (<http://primis.rspa.dot.gov/iim>), available to the general public. This information will include a summary description of the notification, the review status (under review, no objections, objections noted) and a summary of any objections that have been communicated to the operator
